

9 November 2010

## ASX Announcement

### Greenvale Nickel–Cobalt Project (Qld) Phase 2 Drilling Update

- 175 additional drill holes for 4,000m completed at Greenvale
- 6 PQ diamond holes for 189m completed at Greenvale and Lucknow for bulk density and metallurgical purposes
- Additional 2,000 – 3,000m drilling to be completed, expected to be finished late this month
- Assay results for the first 100 holes received (GVM 418 to 517)
- Zones of high grade Nickel & Cobalt intersected outside current resource boundaries
- Updated resource estimate due mid December

A second phase of drilling has commenced at Metallica Minerals Limited's (ASX code" MLM") wholly owned Greenvale nickel-cobalt mine site approximately 170km NW of Townsville in northern Queensland. The drilling is aimed at identifying additional Nickel–Cobalt resources outside the current resource boundaries. To date 175 RC and Aircore holes have been drilled at Greenvale for 4,000m of which assay results have been received for the first 100 holes (GVM418 to 517). Better results received to date include:

#### The Power Line:

GVM 425,	11m @ 1.25% Ni and 0.09% Co (1.43% NiEq <sup>1</sup> )	from 22m
GVM 432,	8m @ 1.49% Ni and 0.14% Co (1.77% NiEq)	from 36m
GVM-434,	10m @ 1.53% Ni and 0.04% Co (1.61% NiEq)	from 35m
GVM-440,	11m @ 2.00% Ni and 0.17% Co (2.34% NiEq)	from 39m

#### The Powder Magazine

GVM-448,	14m @ 1.28% Ni and 0.11% Co (1.50% NiEq)	from 3m
GVM-451,	6m @ 0.87% Ni and 0.37% Co (1.61% NiEq)	from 2m

#### Moonscape

GVM-472,	5m @ 1.58% Ni and 0.07% Co (1.72% NiEq)	from 0m
GVM-475,	8m @ 1.22% Ni and 0.28% Co (1.78% NiEq)	from 2m
GVM-495,	16m @ 1.22% Ni and 0.44% Co (2.10% NiEq)	from 0m
GVM-503,	14m @ 1.39% Ni and 0.13% Co (1.65% NiEq)	from 23m
GVM-507,	8m @ 2.63% Ni and 0.17% Co (2.97% NiEq)	from 2m

<sup>1</sup> The NiEq value equates to Ni+2Co, this is based on a Nickel values of \$9/lb and a Co value of \$18 / lb, scandium (Sc) has **not** been used in the equivalency equation

The Phase 2 drilling is concentrated on the two main zones of high grade Ni – Co mineralisation (The Power Line and The Edge) identified by the Phase 1 drilling completed in July this year. Holes are also being drilled at the Moonscape and Powder Magazine areas where initial drilling has intersected high grade Ni-Co mineralisation close to the surface.

Scandium values for the holes drilled at Greenvale in the Phase 2 drilling program have returned values of between 20–50 g/t Sc and average approximately 35 g/t.

A complete list of drill hole results for holes GVM-418 to 517 is provided in **Table 3** at the back of this report and the location of the holes at Greenvale to date are included as **Figure 2**.

The current Greenvale Indicated and Inferred resource stands at 4.5Mt @ 1.12% Ni and 0.08% Co (1.28% NiEq) with a higher grade zone of 1.43Mt at 1.39% Ni and 0.11% Co (1.61 % NiEq), see **Tables 1 and 2** for the breakdown of the resource categories. The Phase two drilling is targeted at potentially increasing the current resource by between 1Mt to 1.5Mt at comparable grades.

In addition to the RC drilling at Greenvale, Metallica has also completed six PQ diamond drill holes for 189m at the Greenvale and Lucknow deposits. The diamond holes were drilled to obtain samples for bulk density determinations, metallurgical testwork and XRD and petrological studies. It is likely that with the additional bulk density data received from the diamond drilling, the resources which were previously classified as Indicated may be re-classified as Measured in the updated resource estimate due out in mid December.

## Future Work

Work planned for Greenvale to the end of 2010 includes:

- Drilling an additional 150 holes for 4,000m
- Survey pick up of all Phase-2 drill holes
- Survey of existing pit outlines
- Greenvale and Lucknow resource update

*RC Drilling at the Edge – Greenvale Mine Site*

*Technical information and exploration results contained in this report has been compiled by Metallica Minerals Ltd full time employees Andrew Gillies in the position of Managing Director and Metallica Minerals Ltd Exploration Manager, Mr Pat Smith MSc. B.Sc (Hons). Mr Gillies and Mr Smith are members of the Australasian Institute of Mining and Metallurgy and have relevant experience to the mineralisation being reported on to qualify as Competent Persons as defined by the Australasian Code for Reporting of Minerals Resources and Reserves. Mr Gillies and Mr Smith consent to the inclusion in this report of the matters based on the information in the form and context in which it appears*

Figure 2: Greenvale Mine Site – Drill Hole Locations

**GREENVALE NICKEL MINE SITE  
DRILLHOLE LOCATIONS**

**TABLE 1: GREENVALE Ni-Co RESOURCE (SEPTEMBER 2010)**  
(USING A 0.70% NiEq COG)

CLASSIFICATION	Mt	Ni %	Co %	NiEq %	Fe %	Sc g/t
Indicated	3.2	1.16	0.08	1.31	22.0	35
Inferred	1.3	1.03	0.09	1.21	23.0	39
<b>Total</b>	<b>4.5</b>	<b>1.12</b>	<b>0.08</b>	<b>1.28</b>	<b>23.0</b>	<b>36</b>

*The above resource conforms to JORC guidelines for the reporting of mineral resources. The resources have been classed as either Indicated or Inferred based on geological continuity, sample intervals and drill hole spacing. Parts of the resource may be classed as Measured once additional bulk density data has been obtained. The Indicated resource is sufficient for preliminary pit design and scheduling. The Mineral resource estimate is appropriate for a selective open pit mining scenario, but does not account for mining dilution or mining losses.*
